

# Current and future activities on computing and software engineering at the ICCUB Technological Unit

*Tuesday, 8 February 2022 17:05 (25 minutes)*

The ICCUB Technological Unit is contributing to the software development and data processing of several projects. The most important one is Gaia, both on its data processing and on its catalogue validation and data mining aspects, as well as Virgo, where our contributions are ramping up. Besides these, we also participate on several other projects, and we expect to get more manpower soon to consolidate these and to provide support to other ICCUB activities. In this talk I will present and briefly describe all these software engineering and data processing activities.
