Barcelona

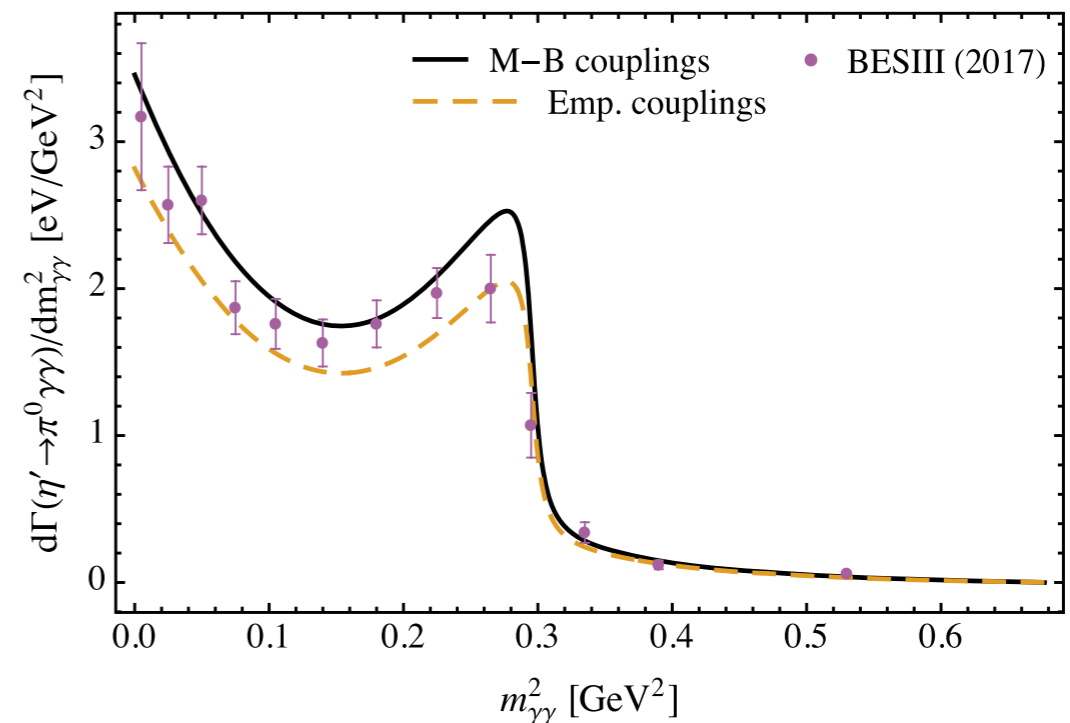

What's the motivation for this analysis?

Theoretical analysis of the doubly radiative decays

$$\eta, \eta' \rightarrow \pi^0 \gamma \gamma \text{ and } \eta' \rightarrow \eta \gamma \gamma$$

Decay	Couplings	Chiral loop	L σ M	VMD	Γ	BR _{th}	BR _{exp} [14]

What's a leptophobic U(1) B boson?

It is a **new gauge boson** coupled to the **baryon number**

$$\mathcal{L} = \frac{1}{3} g_B \bar{q} \gamma^\mu q B_\mu \quad \alpha_B \equiv g_B^2 / (4\pi)$$

The **low-energy symmetries** of QCD are **preserved**

C and **P** are **conserved**

B does not transform under **SU(3) flavour symmetry**

B is a singlet under **isospin**

➔ $I^G(J^{PC}) = 0^-(1^{--})$ ➔ **B is ω meson like!**

What's a leptophobic U(1) B boson?

B is **not** completely **decoupled** from **leptons**

→
$$\mathcal{L}_{\text{int}} = \left(\frac{1}{3} g_B + \varepsilon Q_q e \right) \bar{q} \gamma^\mu q B_\mu - \varepsilon e \bar{\ell} \gamma^\mu \ell B_\mu$$

with a “natural”-sized $\varepsilon = e g_B / (4\pi)^2$ induced radiatively

What's the motivation for a U(1) B boson?

- The **baryon number symmetry** may be related to **dark matter** (it is stabilised since it carries a conserved baryon number charge)
- Natural framework for the **Peccei-Quinn solution** to the **strong CP problem**
- ...

How are hadronic processes calculated?

Using the **hidden local symmetry (HLS)** for **VMD**

$$\mathcal{L}_{VVP} = \frac{G}{\sqrt{2}} \varepsilon^{\mu\nu\alpha\beta} \text{tr} [\partial_\mu V_\nu \partial_\alpha V_\beta P] \quad \text{with} \quad G = \frac{3g^2}{4\pi^2 f_\pi}$$

P is the pseudoscalar meson nonet

V is the vector meson nonet

(**gauge bosons** of a hidden **U(3)_v symmetry**)

In **conventional VMD**:

$$\mathcal{L}_{V\gamma} = -4egf_\pi^2 A^\mu \text{tr} [QV_\mu]$$

$$\mathcal{L}_{VB} = -4\frac{1}{3}g_B g f_\pi^2 B^\mu \text{tr} [V^\mu]$$

How are hadronic processes calculated?

$$\Gamma_{B \rightarrow \pi^0 \gamma} = \frac{\alpha_{\text{em}} \alpha_B m_B^3}{96 \pi^3 f_\pi^2} \left(1 - \frac{m_\pi^2}{m_B^2}\right)^3 |F_\omega(m_B^2)|^2$$

Previous estimates

Assuming the **Narrow Width Approximation (NWA)**:

$$\text{BR}(\eta \rightarrow \pi^0 \gamma \gamma) = \text{BR}(\eta \rightarrow B \gamma) \times \text{BR}(B \rightarrow \pi^0 \gamma)$$

and

$$\text{BR}(B \rightarrow \pi^0 \gamma) = 1$$

and **QCD contribution off**

and

$$\text{BR}(\eta \rightarrow \pi^0 \gamma \gamma) < \text{BR}_{\text{exp}} \text{ at } 2\sigma$$

Present estimates from this analysis

Assuming the **NWA**

and **QCD contribution off**

and

$$\text{BR}(\eta \rightarrow \pi^0 \gamma \gamma) < \text{BR}_{\text{exp}} \text{ at } 2\sigma$$

and including the
latest experimental BRs

However, a lot more can be done nowadays!

Using the **new BR** value and **spectrum** from **KLOE** for

$$\eta \rightarrow \pi^0 \gamma \gamma$$

B. Cao [KLOE-2], PoS EPS-HEP2021 (2022) 409
E. Pérez del Rio, CD21

Using the **recent BR** value and **spectrum** from **BESIII** for

$$\eta' \rightarrow \pi^0 \gamma \gamma$$

M. Ablikim *et. al.* [BESIII], Phys. Rev. D 96 (2017) 012005

Using the **recent BR** value from **BESIII** for

$$\eta' \rightarrow \eta \gamma \gamma$$

M. Ablikim *et. al.* [BESIII], Phys. Rev. D 100 (2019) 052015

How are these processes calculated?

VMD:
$$\mathcal{A}_{\eta \rightarrow \pi^0 \gamma \gamma}^{\text{VMD}} = \sum_{V=\rho^0, \omega, \phi} g_{V\eta\gamma} g_{V\pi^0\gamma} \left[\frac{(P \cdot q_2 - m_\eta^2) \{a\} - \{b\}}{D_V(t)} + \left\{ \begin{array}{l} q_2 \leftrightarrow q_1 \\ t \leftrightarrow u \end{array} \right\} \right]$$

LσM:
$$\mathcal{A}_{\eta \rightarrow \pi^0 \gamma \gamma}^{\text{L}\sigma\text{M}} = \frac{2\alpha_{em}}{\pi} \frac{1}{m_{K^+}^2} L(s_K) \{a\} \times \mathcal{A}_{K^+ K^- \rightarrow \pi^0 \eta}^{\text{L}\sigma\text{M}}$$

B boson:
$$\mathcal{A}_{\eta \rightarrow \pi^0 \gamma \gamma}^{\text{B boson}} = g_{B\eta\gamma}(t) g_{B\pi^0\gamma}(t) \left[\frac{(P \cdot q_2 - m_\eta^2) \{a\} - \{b\}}{D_B(t)} + \left\{ \begin{array}{l} q_2 \leftrightarrow q_1 \\ t \leftrightarrow u \end{array} \right\} \right]$$

$$g_{B\pi^0\gamma}(t) = \frac{eg_B}{4\pi^2 f_\pi} F_\omega(t) \quad F_V(s) = \frac{m_V^2}{m_V^2 - s - im_V \Gamma_V}$$

$$g_{B\eta\gamma}(t) = \frac{eg_B}{12\pi^2 f_\pi} \left[\cos \varphi_P F_\omega(t) + \sqrt{2} \sin \varphi_P F_\phi(t) \right]$$

$$D_B(t) = m_B^2 - t - i\sqrt{t} \Gamma_B(t)$$

How are these processes calculated?

B boson width:

$$\Gamma_B(t) = \frac{\tilde{\Upsilon}_{B \rightarrow e^+e^-}(t)}{\tilde{\Upsilon}_{B \rightarrow e^+e^-}(m_B^2)} \Gamma_{B \rightarrow e^+e^-} \theta(t - 4m_e^2) + \frac{\tilde{\Upsilon}_{B \rightarrow \pi^0\gamma}(t)}{\tilde{\Upsilon}_{B \rightarrow \pi^0\gamma}(m_B^2)} \Gamma_{B \rightarrow \pi^0\gamma} \theta(t - m_{\pi^0}^2) + \frac{\tilde{\Upsilon}_{B \rightarrow \mu^+\mu^-}(t)}{\tilde{\Upsilon}_{B \rightarrow \mu^+\mu^-}(m_B^2)} \Gamma_{B \rightarrow \mu^+\mu^-} \theta(t - 4m_\mu^2)$$

$$+ \frac{\tilde{\Upsilon}_{B \rightarrow \pi^+\pi^-}(t)}{\tilde{\Upsilon}_{B \rightarrow \pi^+\pi^-}(m_B^2)} \Gamma_{B \rightarrow \pi^+\pi^-} \theta(t - 4m_\pi^2) + \frac{\tilde{\Upsilon}_{B \rightarrow \pi^+\pi^-\pi^0}(t)}{\tilde{\Upsilon}_{B \rightarrow \pi^+\pi^-\pi^0}(m_B^2)} \Gamma_{B \rightarrow \pi^+\pi^-\pi^0} \theta(t - 9m_\pi^2),$$

New exclusion plots

Not assuming the **NWA**

and **QCD** contribution on

and

$$\text{BR}(\eta \rightarrow \pi^0 \gamma \gamma) < \text{BR}_{\text{exp}} \text{ at } 2\sigma$$

$$\text{BR}(\text{PDG}) = (2.56 \pm 0.22) \times 10^{-4}$$

P. A. Zyla *et. Al.* [PDG], PTEP 2020 (2020) 093C01

$$\text{BR}(\text{KLOE}) = (1.23 \pm 0.14) \times 10^{-4}$$

B. Cao [KLOE-2], PoS EPS-HEP2021 (2022) 409

R. Escribano, S. González-Solís and E. Royo, Phys. Rev. D 106 (2022) 114007

New exclusion plots

$$\eta' \rightarrow \pi^0 \gamma \gamma$$

$$\text{BR}(\text{BESIII}) = (3.20 \pm 0.07 \pm 0.23) \times 10^{-3}$$

M. Ablikim et. al. [BESIII], Phys. Rev. D 96 (2017) 012005

$$\eta' \rightarrow \eta \gamma \gamma$$

$$\text{BR}(\text{BESIII}) = (8.25 \pm 3.41 \pm 0.72) \times 10^{-3}$$

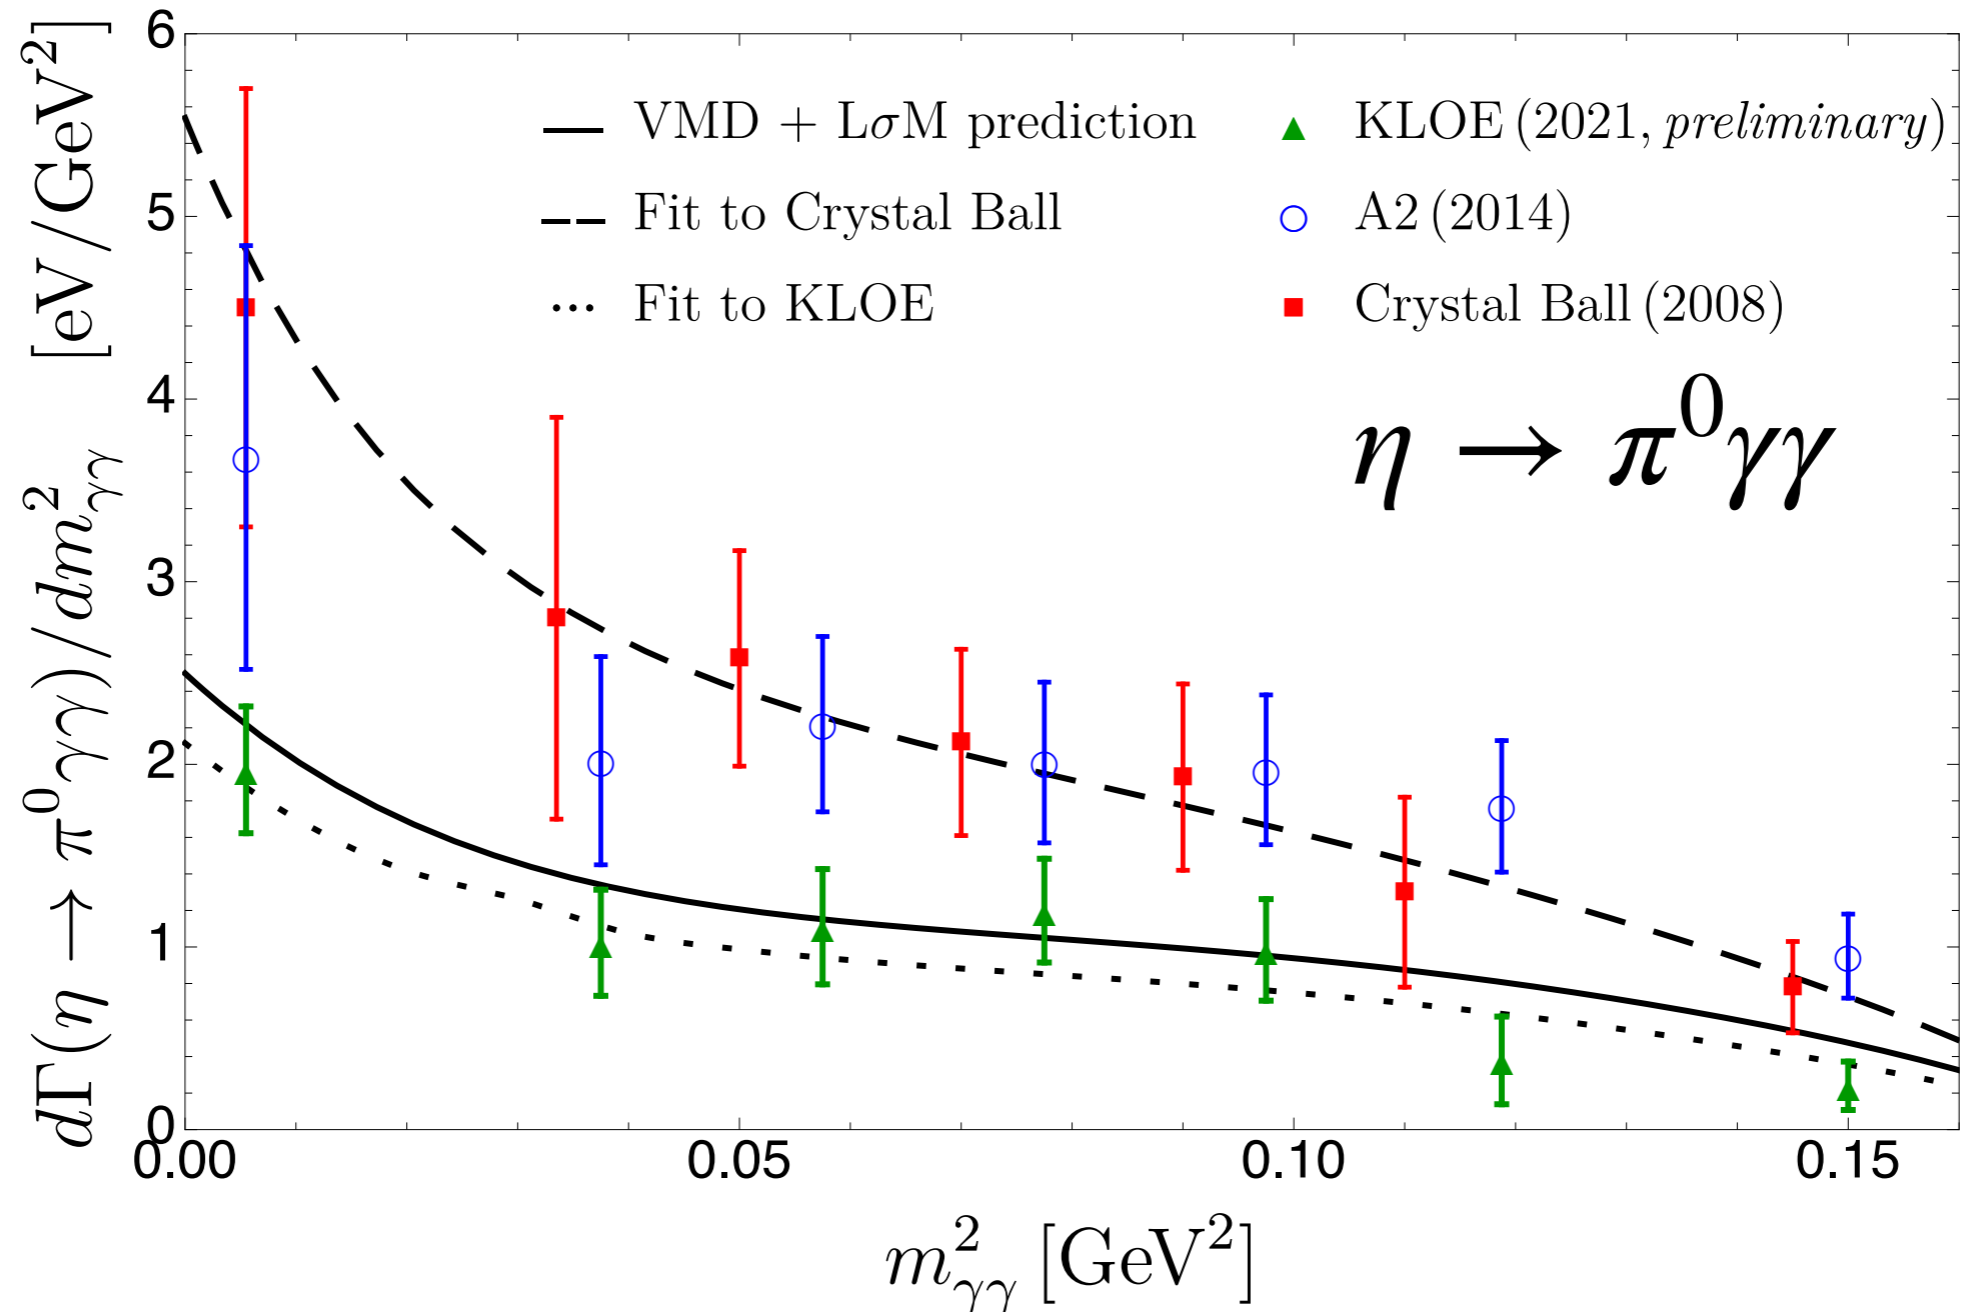

M. Ablikim et. al. [BESIII], Phys. Rev. D 100 (2019) 052015

R. Escribano, S. González-Solís and E. Royo, Phys. Rev. D 106 (2022) 114007

Are peaks in the $\pi^0\gamma$ mass distribution seen

Fits to the $\gamma\gamma$ mass distribution

Crystal Ball:	$\alpha_B = 0.40^{+0.07}_{-0.08}$,	$m_B = 583^{+32}_{-20}$ MeV	$\chi^2_{\min}/\text{dof} = 0.4/5 = 0.1$
KLOE:	$\alpha_B = 0.049^{+40}_{-27}$,	$m_B = 135^{+1}_{-135}$ MeV	$\chi^2_{\min}/\text{dof} = 4.5/5 = 0.9$

Fits to the $\gamma\gamma$ mass distribution

BESIII: $\alpha_B = 0.005(1)$, $m_B = 759(1)$ MeV $\alpha_B = 0.018(5)$, $m_B = 156_{-1}^{+5}$ MeV

$$\chi^2_{\min}/\text{dof} = 11.7/11 = 1.1$$

$$\chi^2_{\min}/\text{dof} = 12.5/11 = 1.1$$

Fits to the $\gamma\gamma$ mass distribution

Joint Fit

$$\alpha_B = 0.005(1), \quad m_B = 759(1) \text{ MeV}$$

$$\chi_{\min}^2/\text{dof} = 19.6/18 = 1.1$$

$$\alpha_B = 5(2) \times 10^{-4}, \quad m_B = 780_{-4}^{+3} \text{ MeV}$$

$$\chi_{\min}^2/\text{dof} = 23.7/18 = 1.3$$

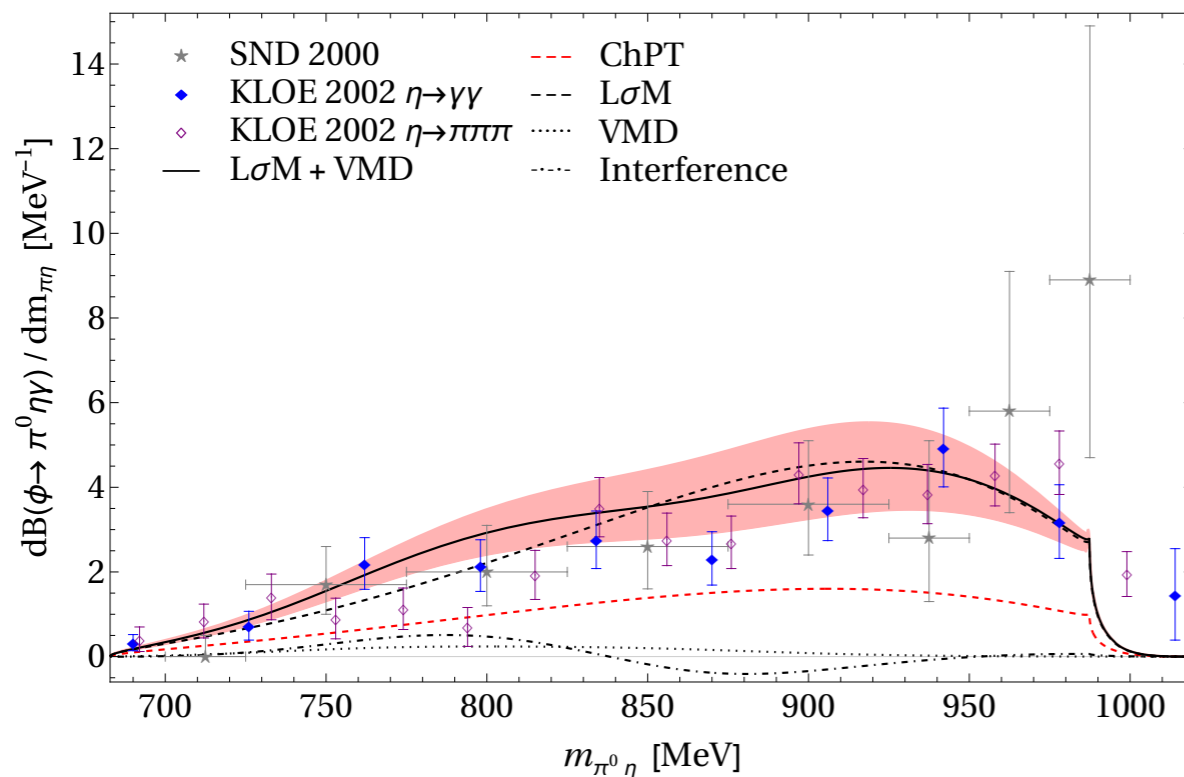

BESIII data dominates the fit

In preparation: $\phi \rightarrow \pi^0 \eta \gamma$

Conclusions

- The sensitivity of the **rare decays** $\eta, \eta' \rightarrow \pi^0 \gamma \gamma$ and $\eta' \rightarrow \eta \gamma \gamma$ to a **leptophobic U(1) B boson** in the **mass range MeV-GeV** has been analysed in detail
- Stringent limits on the **B boson parameters** m_B and α_B have been found
- The current constraints have been strengthened by **one order of magnitude** from $\eta \rightarrow \pi^0 \gamma \gamma$
- These constraints would make a **B-boson signature** strongly suppressed

Conclusions
