Hadron interactions using three-quark potential in a constituent quark model

Thursday 11 July 2024 16:30 (20 minutes)

In this work, we investigate the hadron interactions using the three-quark potential in a constituent quark model. Three-quark potentials have only been studied for simple cases because it is difficult to calculate the three-color interaction matrix and determine the radial dependence of potential. In the case of a multiquark system, the three-quark color matrix can be calculated using the permutation matrix, but when there are antiquarks, a different method must be used. In order to calculate the three-quark potential, we use the commutation and anticommutation relations of SU(3) and apply it to exotic hadron configurations.
