

On the origin of the complex energy-dependent structure of HESS J1702-420

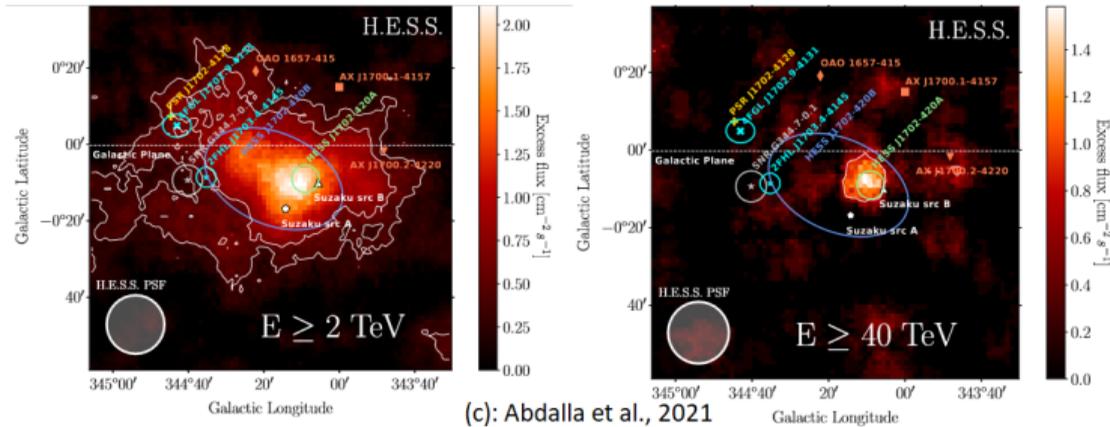

D. Malyshev, M. Chernyakova, F. Aharonian

7th Heidelberg International Symposium on High-Energy Gamma-Ray Astronomy

5th July 2022

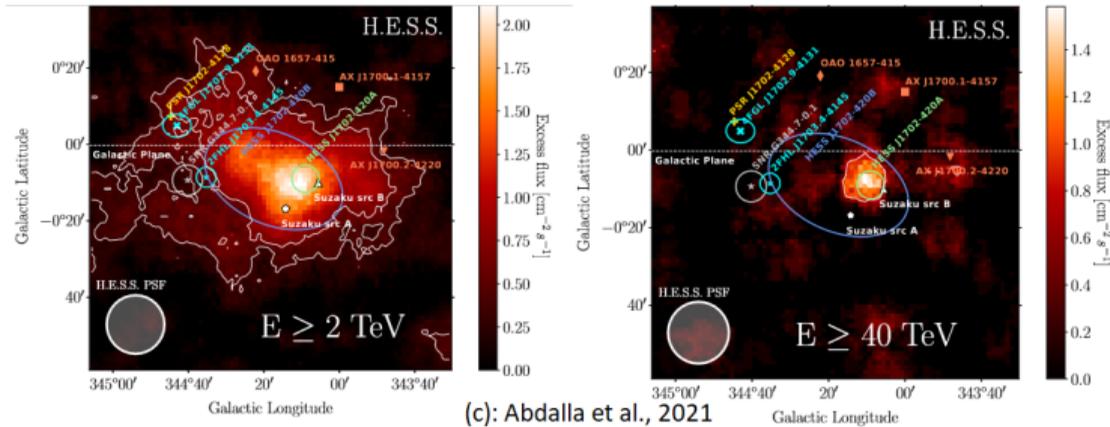

HESS J1702-420: Introduction

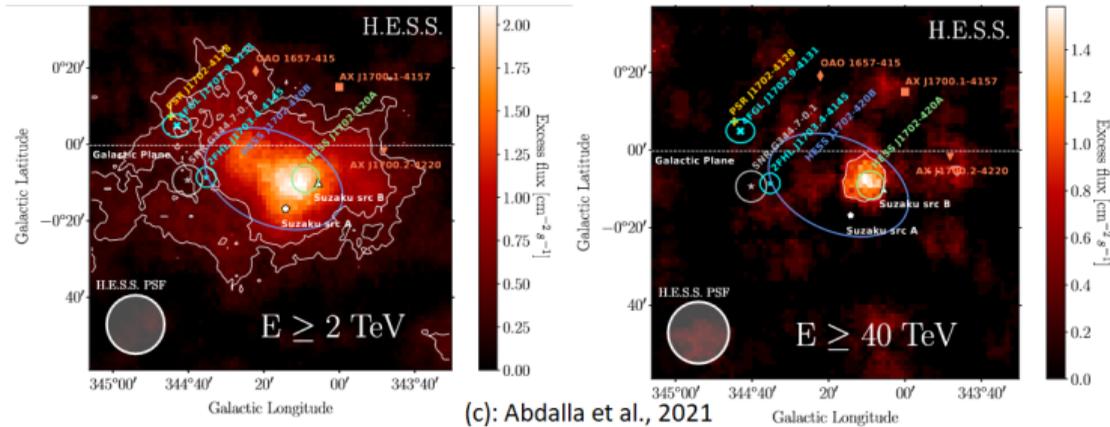

- Discovered in 2006 during the first HESS galactic plane survey

HESS J1702-420: Introduction

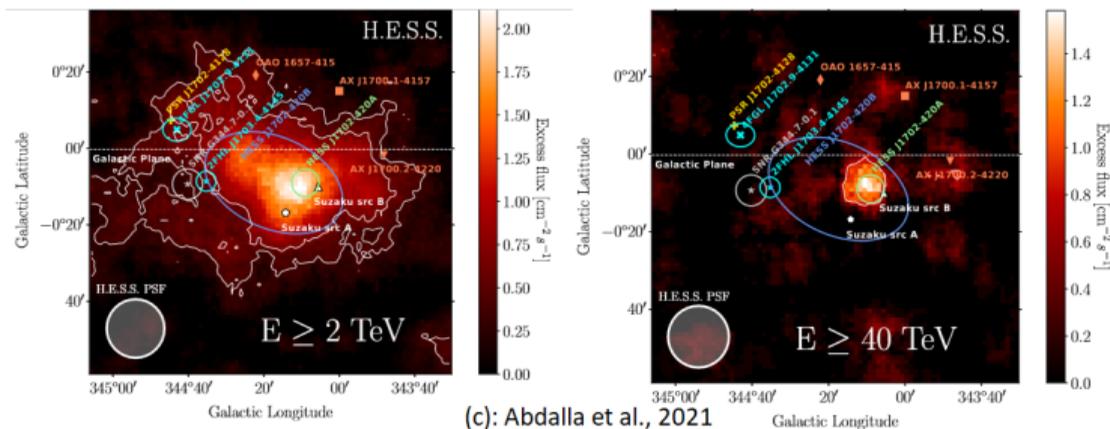

- ▶ Discovered in 2006 during the first HESS galactic plane survey
- ▶ $\sim 15^\circ$ away from the GC; origin unknown

HESS J1702-420: Introduction

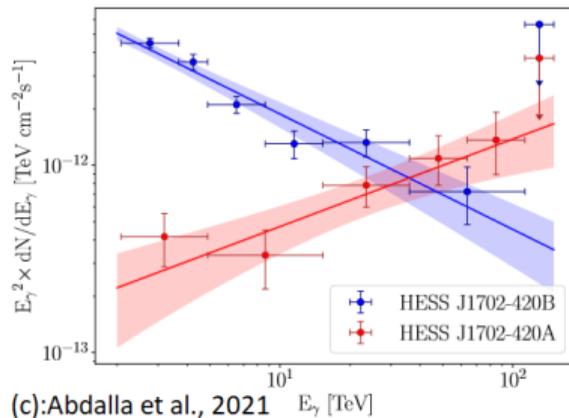

- ▶ Discovered in 2006 during the first HESS galactic plane survey
- ▶ $\sim 15^\circ$ away from the GC; origin unknown
- ▶ 2021, Abdalla et al.: Diffuse source with energy dependent morphology
- ▶ Size changes from $\sim 0.3^\circ$ below 5 TeV to point-like above 30-40 TeV

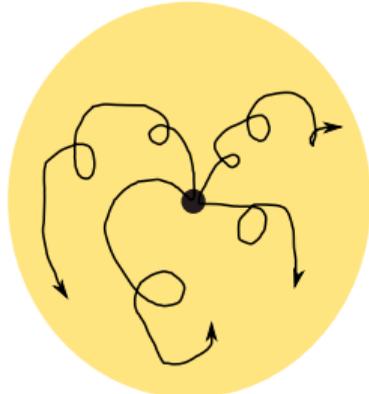

HESS J1702-420: Introduction

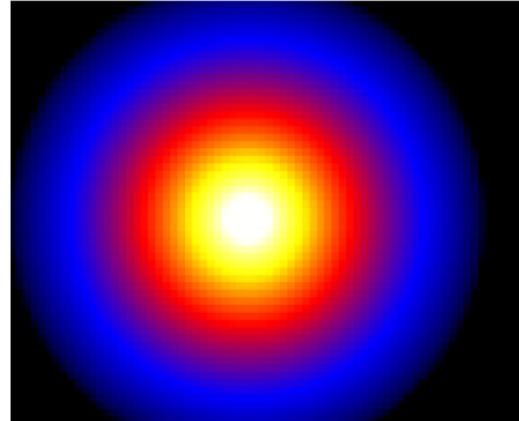

- ▶ Discovered in 2006 during the first HESS galactic plane survey
- ▶ $\sim 15^\circ$ away from the GC; origin unknown
- ▶ 2021, Abdalla et al.: Diffuse source with energy dependent morphology
- ▶ Size changes from $\sim 0.3^\circ$ below 5 TeV to point-like above 30-40 TeV
- ▶ Morphology: **point-like** HESS J1702-420A + **diffuse** HESS J1702-420B

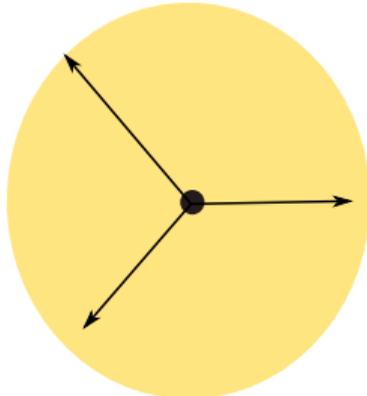

- ▶ Spectra: powerlaw with no cut-off indications up to 100 TeV
- ▶ HESS J1702-420A: $\Gamma = 1.53 \pm 0.19_{stat} \pm 0.20_{syst}$
- ▶ HESS J1702-420B: $\Gamma = 2.62 \pm 0.10_{stat} \pm 0.20_{syst}$
- ▶ Motivation: Describe simultaneously and self-consistently spectral/spatial behaviour of both (A+B) sources.

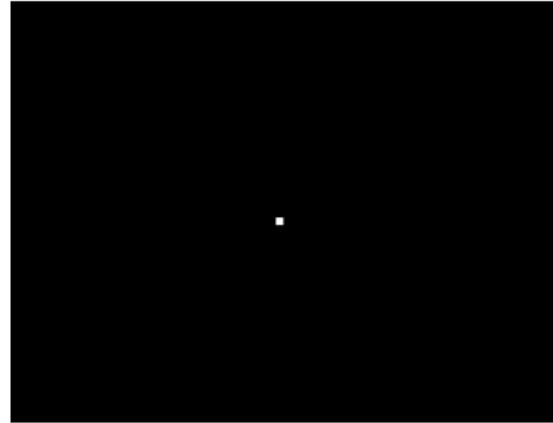

Diffusive regime

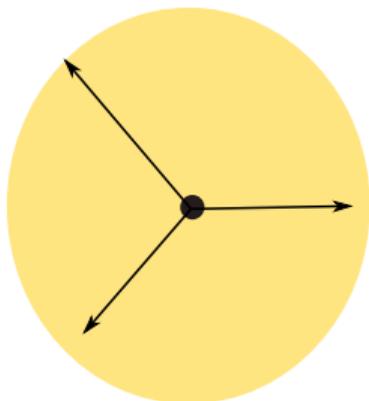

- ▶ An accelerator of VHE protons at the center of HI cloud. Observed photons – π^0 decay.
- ▶ Propagation of protons is described with energy dependent diffusion
$$D(E) = D_0(E/1TeV)^{i_d}$$
- ▶ “Low” energies: diffusive propagation; protons are entangled and randomized in momenta space \Rightarrow “Extended” source

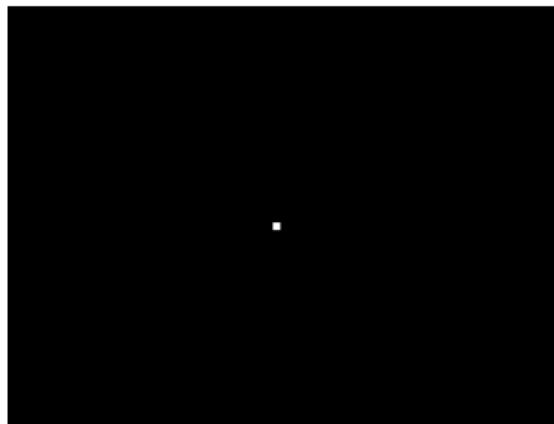

Rectilinear regime

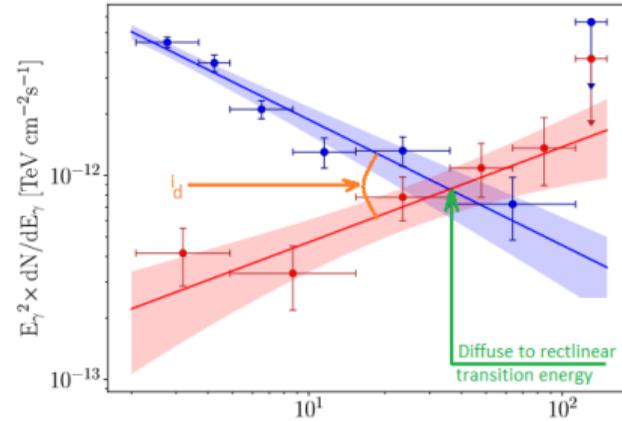

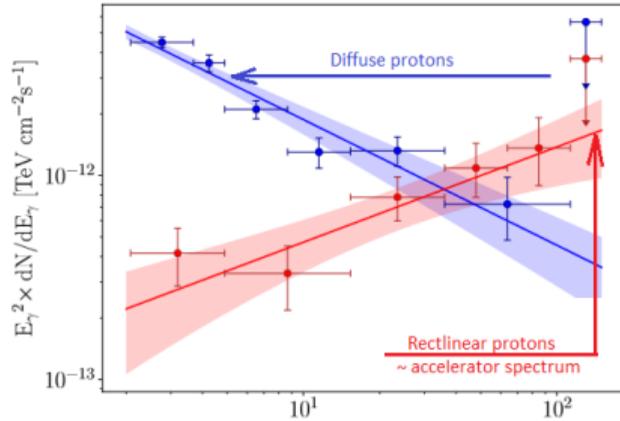

- ▶ An accelerator of VHE protons at the center of HI cloud. Observed photons – π^0 decay.
- ▶ Propagation of protons is described with energy dependent diffusion
$$D(E) = D_0(E/1TeV)^{i_d}$$
- ▶ **“High”** energies: rectilinear propagation of protons \Rightarrow “point-like” source

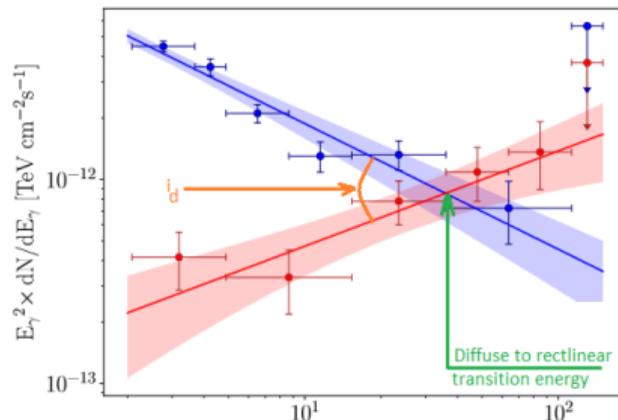

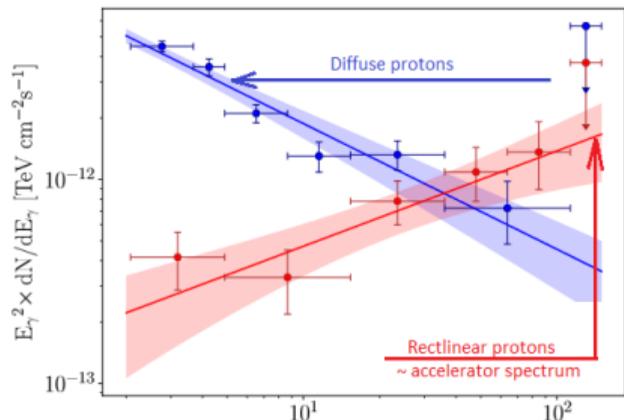

Rectilinear regime

- ▶ An accelerator of VHE protons at the center of HI cloud. Observed photons – π^0 decay.
- ▶ Propagation of protons is described with energy dependent diffusion
$$D(E) = D_0(E/1TeV)^{i_d}$$
- ▶ **“High”** energies: rectilinear propagation of protons \Rightarrow “point-like” source
- ▶ **Transition criteria:** diffusion time longer than free-fly time: $r^2/D \gg r/c$

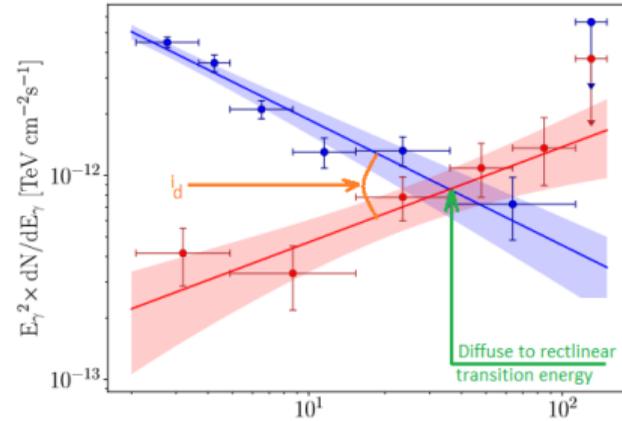

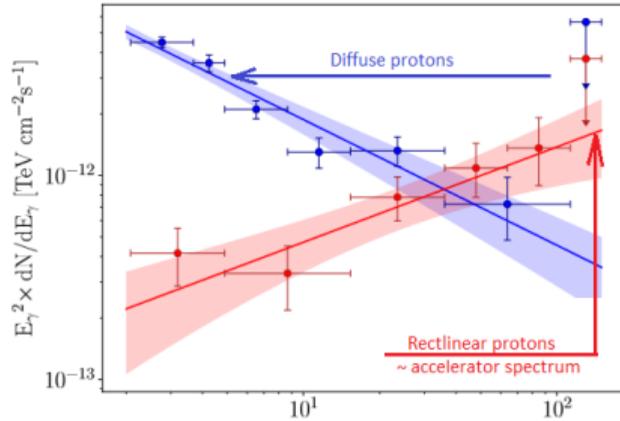

- ▶ An accelerator **energetics and spectrum**: point-like source spectrum (+density; +cloud size)

- An accelerator **energetics and spectrum**: point-like source spectrum (+density; +cloud size)

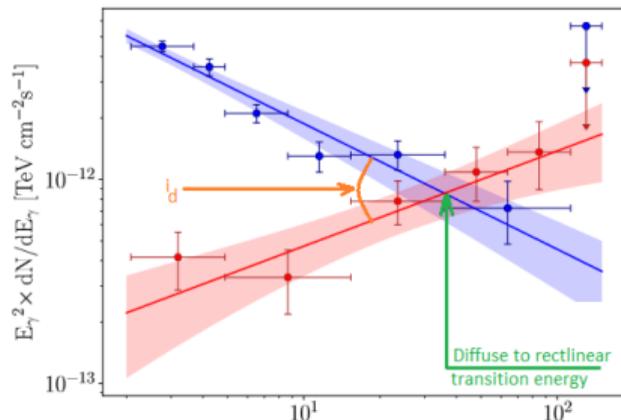

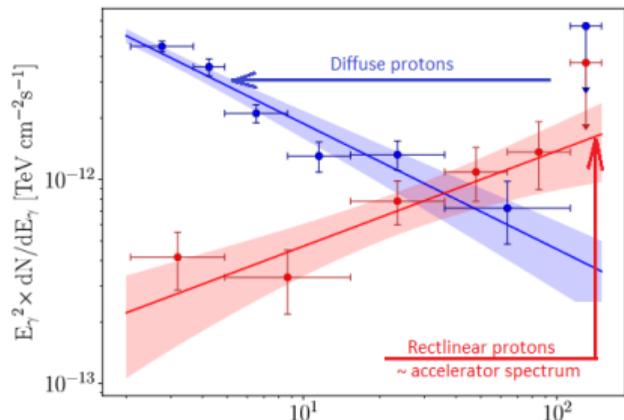

$$dN/dE \propto Q_{100}(E_p/1TeV)^{i_p}; i_p \sim 1.5$$

$$F_{ph} = \frac{\kappa L_p}{4\pi D^2} \frac{t_{esc}}{t_{pp}} \simeq 10^{-12} \frac{Q_{100} n_0}{10^{40} \text{erg/s cm}^{-3}} \frac{\kappa}{1/6} \frac{R}{20 \text{pc}} \left(\frac{D}{3.5 \text{kpc}} \right)^{-2} \text{erg/s/cm}^2$$

- **Diffusion coefficient index:** difference of diffuse and point-like sources spectral indexes:

$$i_d \sim 1$$

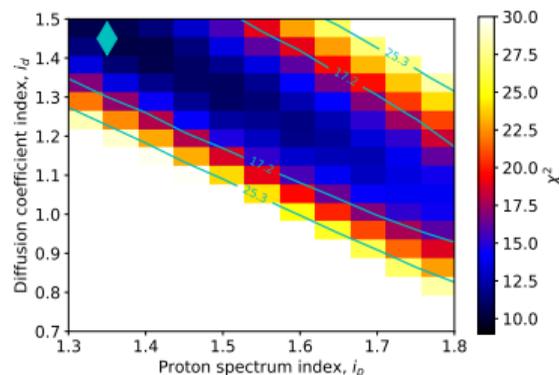

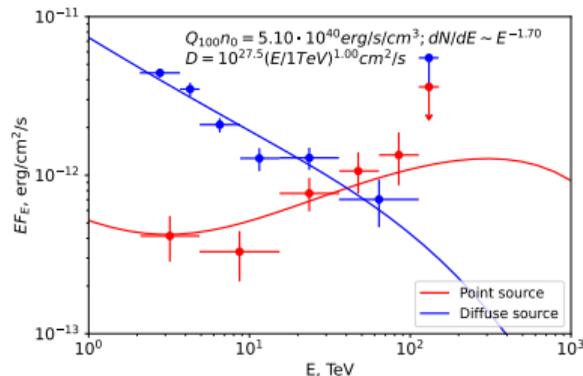

- ▶ **Diffusion coefficient index:** difference of diffuse and point-like sources spectral indexes:

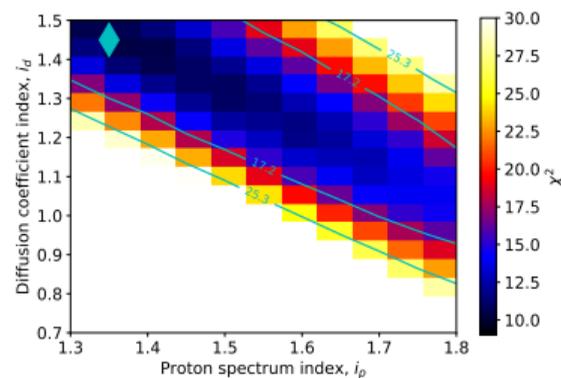

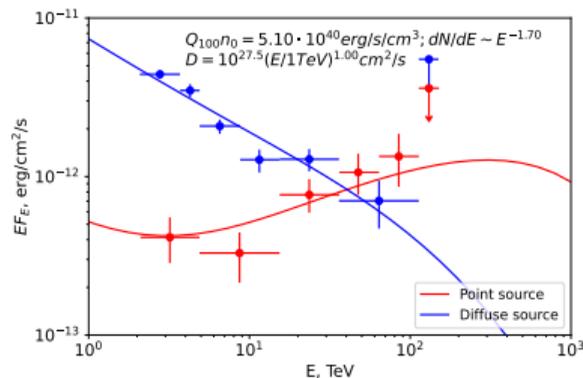

$$i_d \sim 1$$

- ▶ **Diffusion coefficient normalisation:** transition energy:

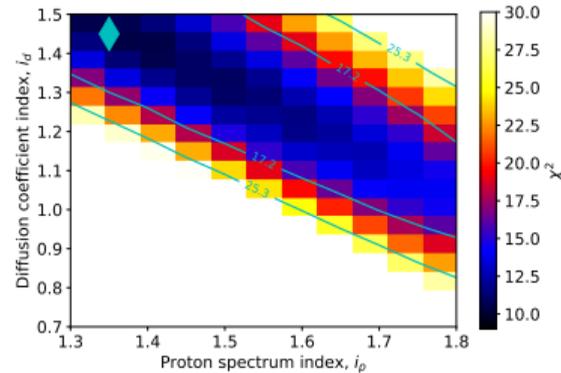

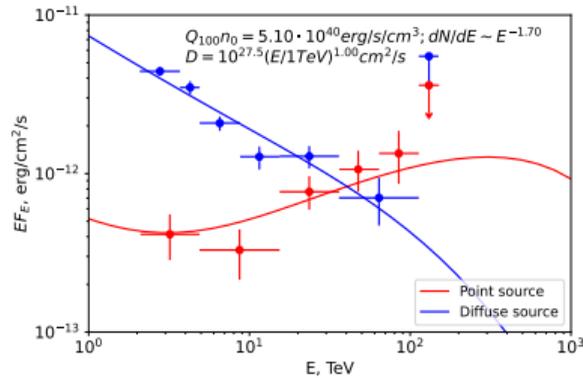

$$D_0 \lesssim \frac{Rc\beta}{(E_c/1\text{TeV})^{i_d}} \sim 6 \cdot 10^{26} \frac{R}{20\text{pc}} \left(\frac{E_c}{30\text{TeV}} \right)^{-i_d} \frac{\beta}{0.01} \text{cm}^2/\text{s}$$

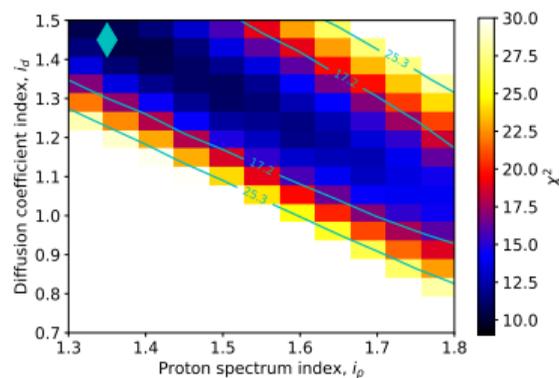

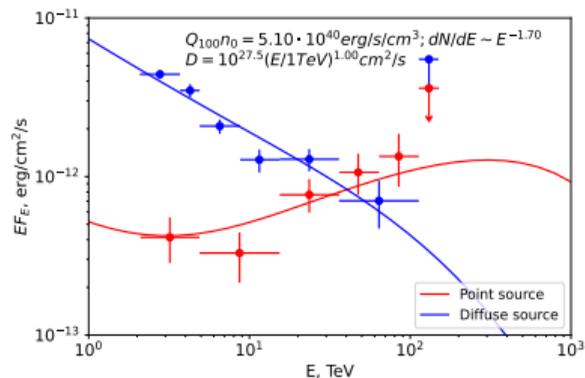

- ▶ Relativistic diffusion distribution function for protons describing evolution in space and momenta space: analytical expression from Prosekin et al. 2015
- ▶ Photon emission processes – **naima** (v.0.9.1, Zabalza et al, 2015)
- ▶ Secondary electrons production – **aafragpy** (v.1.12, Koldobskiy et al., 2021)

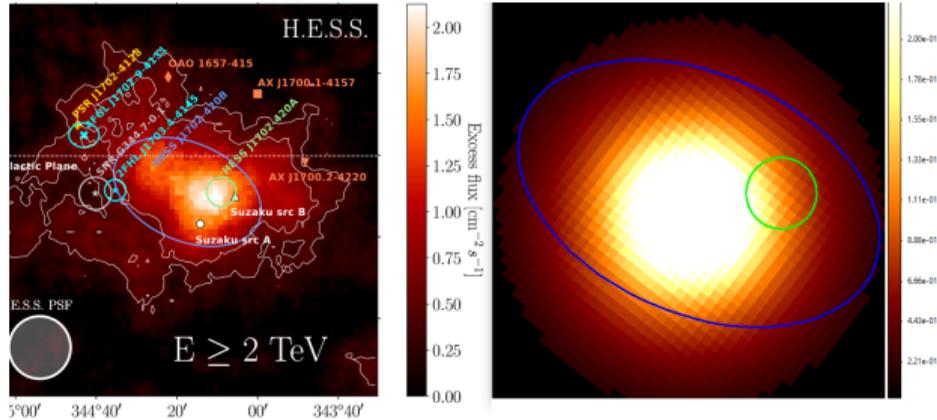

- ▶ Formal fit prefers $i_d \sim 1.45$, but Bohm-like diffusion is not excluded
- ▶ $D_0 \approx 10^{26.2} \text{ cm}^2/\text{s}$ at 1 TeV, by a factor of 100 faster than Bohm for $B_0 = 10 \mu\text{G}$

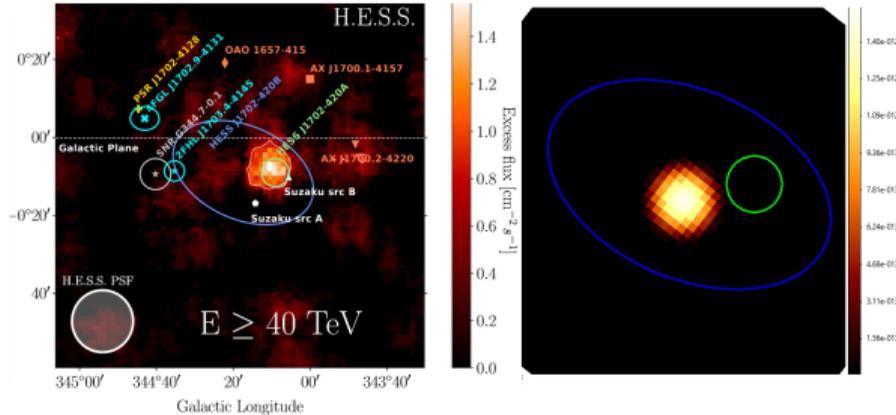

- For Bohm-like diffusion $Q_{100}n_0 \sim 5 \cdot 10^{40} \text{ erg/s/cm}^3$. Comparable to Crab energetics for $n_0 \sim 100 \text{ cm}^{-3}$

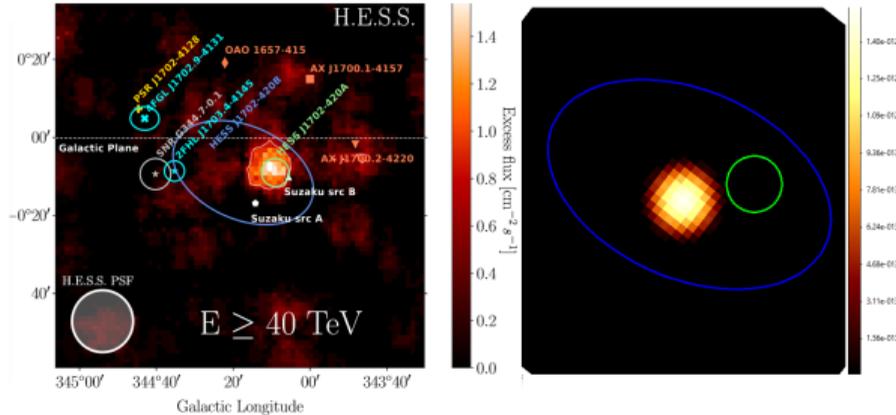

- ▶ For Bohm-like diffusion $Q_{100}n_0 \sim 5 \cdot 10^{40}$ erg/s/cm³. Comparable to Crab energetics for $n_0 \sim 100$ cm⁻³
- ▶ Energetics could be further decreased, if the accelerator/cloud are located closer and/or are denser. $Q_{100} \sim D$. Abdalla et al., 2021: nearby dense (200-700 cm⁻³) clouds at ~ 0.3 kpc...

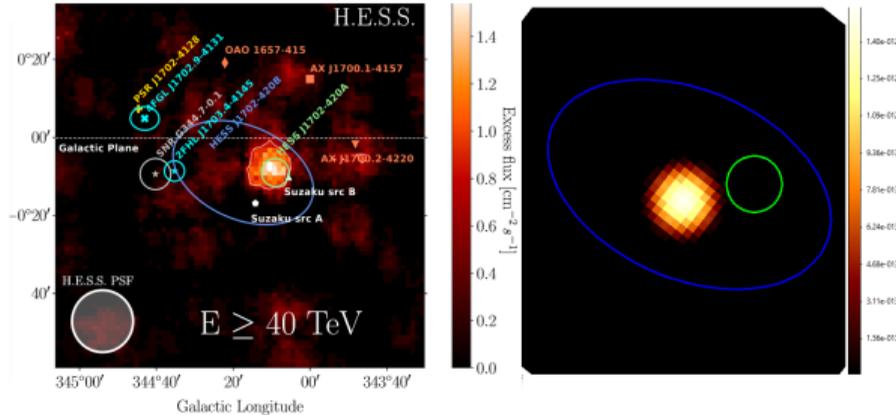

- ▶ The model well describes the energy-dependent changes of HESS J1702-420 morphology

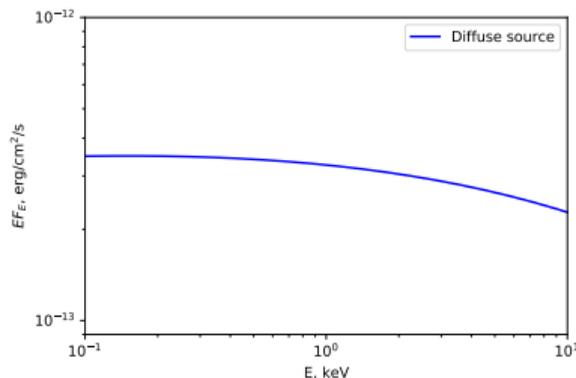

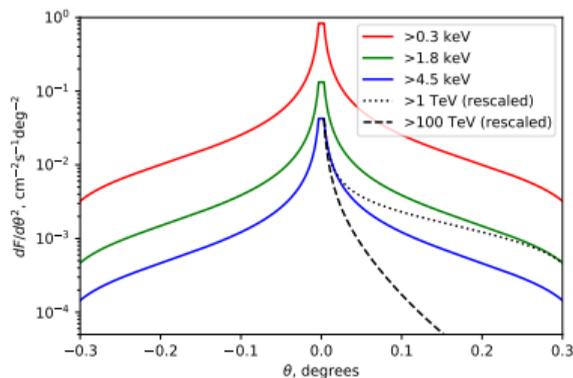

- ▶ The data demonstrates offset of the point-like source from the the center of diffuse source.

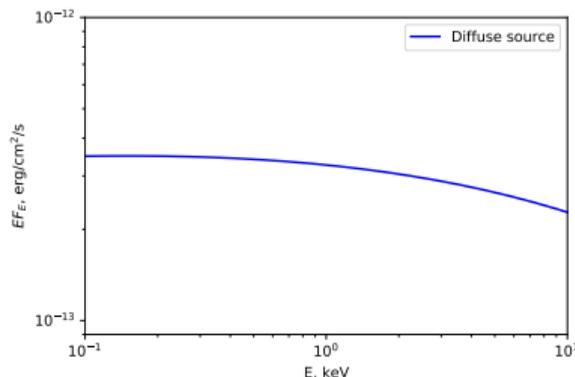

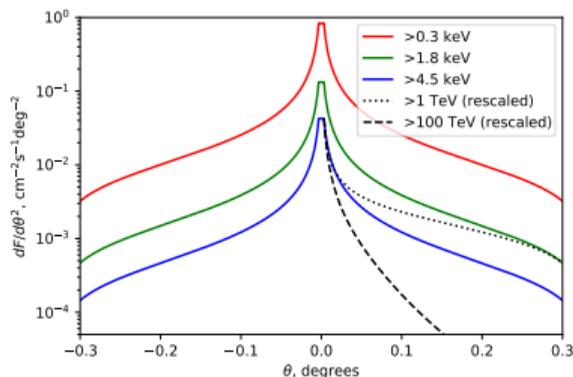

- ▶ The data demonstrates offset of the point-like source from the the center of diffuse source.
- ▶ Misaligned proton accelerator? Space-dependent diffusion coefficient?

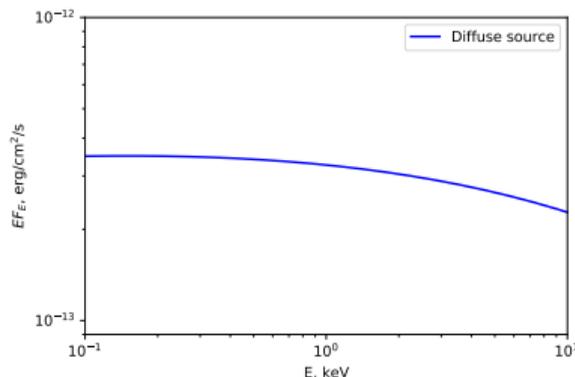

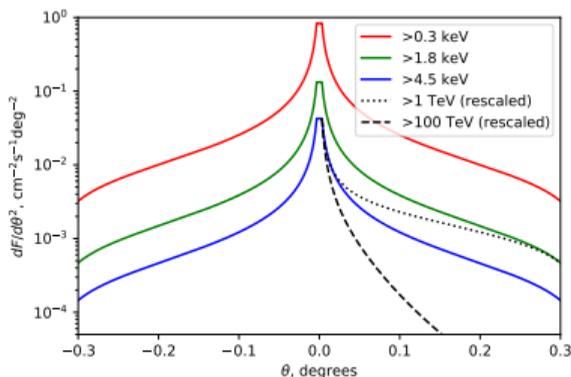

- ▶ **Strongly misaligned accelerator** (PeVatron) could illuminate nearby cloud which will show soft spectrum. The hard-spectrum accelerator **remains invisible or visible just at highest energies.**

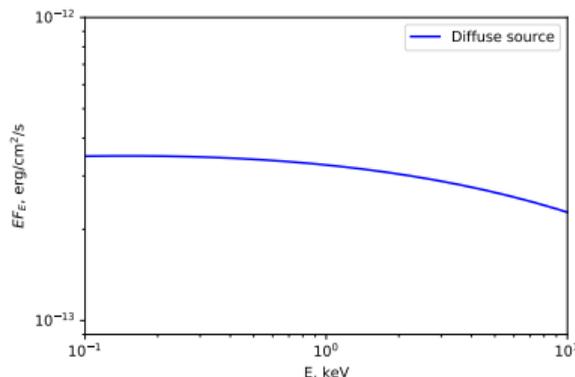

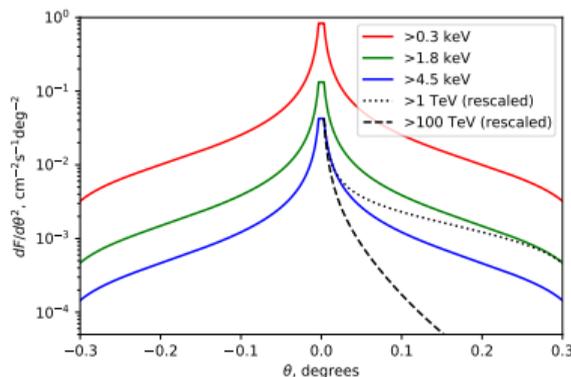

- ▶ Secondary electrons: **synchrotron** emission in the keV band?

- ▶ Secondary electrons: **synchrotron** emission in the keV band?
- ▶ For the magnetic field of $10 \mu\text{G}$ and Bohm diffusion secondary electrons emit synchrotron close to the production place, but have enough time to isotropise over momenta even at highest energies.

- ▶ Secondary electrons: **synchrotron** emission in the keV band?
- ▶ For the magnetic field of $10 \mu\text{G}$ and Bohm diffusion secondary electrons emit synchrotron close to the production place, but have enough time to isotropise over momenta even at highest energies.
- ▶ Hard-spectrum ($\Gamma \sim -2$), diffuse ($\sim 0.05^\circ$ -radius) X-ray source, detectable by **XMM-Newton/eROSITA**

- ▶ Secondary electrons: **synchrotron** emission in the keV band?
- ▶ For the magnetic field of $10 \mu\text{G}$ and Bohm diffusion secondary electrons emit synchrotron close to the production place, but have enough time to isotropise over momenta even at highest energies.
- ▶ Hard-spectrum ($\Gamma \sim -2$), diffuse ($\sim 0.05^\circ$ -radius) X-ray source, detectable by **XMM-Newton/eROSITA**
- ▶ Non-detection – **non-continuous injection** of protons ($t < t_{\text{sync}} \sim 1000$ yr)

- ▶ Energy-dependent diffusion allows to explain energy-dependent morphology of VHE sources.
- ▶ HESS J1702-420 can be modelled as a proton accelerator embedded into HI cloud + energy-dependent diffusion + π^0 -decay emission
- ▶ The data is well described with Bohm-like diffusion (~ 100 times faster for $B = 10 \mu\text{G}$). The required energetics of the accelerator is comparable to Crab for the medium density $n_0 \sim 100 \text{ cm}^{-3}$
- ▶ The energetics can be decreased if HI cloud is located at $D < 3.5$ kpc. Several such clouds were reported in Abdalla et al., 2021
- ▶ Strongly misaligned accelerator (PeVatron) could illuminate nearby cloud which will show soft spectrum. The hard-spectrum accelerator remains invisible or visible just at highest energies.
- ▶ Secondaries can produce detectable X-ray emission. Non-detection would indicate non-continuous injection of protons at $t < t_{\text{sync}} \sim 1000$ yr

¡Gracias por las atenciones!
