

7th Heidelberg International Symposium on High-Energy Gamma-Ray Astronomy

Contribution ID: 328

Type: **Review, Highlight, or Invited talk**

Highlights from H.E.S.S.

Monday, 4 July 2022 12:45 (25 minutes)

The High Energy Stereoscopic System is the only facility available for studying the Very High Energy sky in the Southern Hemisphere. In 2019 it was upgraded with a new camera on its CT5 telescope and has been continuously operated during the Covid pandemic. During this period, new sources, source classes and phenomena were discovered and in-depth surveys and analyses were conducted. This presentation describes the highlights of H.E.S.S. observations during the last three years and presents an outlook for the newly approved extension of science operations.
