## The Holographic QCD Running Coupling Constant from the Ricci Flow

Friday 4 October 2024 13:00 (10 minutes)

Through a holographic model of QCD, we present a phenomenological approach to study the running of the strong coupling constant  $\alpha$ s in both non-perturbative and perturbative regimes. The renormalization of the metric tensor, driven by the Ricci Flow, and the breaking of conformal and chiral symmetries – thanks to introducing a double dilaton model and large-Nc corrections – allow us to relate the existence of an infrared fixed point in the coupling constant with a smooth matching to pQCD well above 2 GeV. The proposed dilaton model yields linear Regge trajectories and vector decay constants similar to their experimental counterparts.
