Short Overview

- MQ Jets @ High Energy Particles (intro & context)
- On Particle Acceleration in MQs (sites & processes)
- Fermi-type Particle Acceleration (focus on scales beyond binary)
- Characteristics & Expectations (timescales & efficiency)

Congratulations on the Career & Success of Josep Maria!

Microquasars are X-ray binary stars capable of generating relativistic jets. Galactic microquasars are one of the most recent additions to the field of high energy astrophysics and have attracted increasing interest over the last decade. They are now primary targets for all space-based observatories working in the X-ray and γ -ray domains. The hope is that their study will enable us to understand some of the analogous phenomena observed in distant quasars and active galactic nuclei, which have practically the same scaled-up physics as microquasars. Microquasars are also believed to be

(Paredes & Marti 2003)

Figure 1. Distribution of known microquasars in galactic coordinates. Filled circles represent those sources where relativistic jets have been imaged, while open circles are used for those where hints of relativistic jets have been seen or are clearly suspected.

PLASMA ASTRO

HESS+2024 & Gamma24

-1°30

-2°00'

- MQs as PeV particle accelerators (caveat: IC, boosting?)
- U/VHE far away from binary system (HAWC, HESS, LHAASO)

green cross = MQ-BH position

LHAASO+2024

Context (III)

Gamma-ray production mechanisms in MQ jets (modulo activity states, radio/X-ray outbursts):

• Leptonic: IC - SSC or EC (e.g., with companion or interstellar radiation fields) (e.g., Atoyan & Aharonian 1999; Paredes+ 2000; Georganopoulos+ 2002; Bordas+2009...)

 $h \nu \sim \gamma_e m_e c^2$ (KN) \Rightarrow if $\epsilon_{\gamma} := h\nu \gtrsim 100 \text{ TeV} \Rightarrow \gamma_e \gtrsim 10^8$ [neglecting boosting]

- Hadronic: pp-interactions (e.g., with companion stellar wind or ISM/clouds) (e.g., Romero+ 2003; Dermer & Böttcher 2006; Bosch-Ramon+ 2006; ...)
 - ► mean energy $\varepsilon_{\gamma} \sim 0.1 \ E_{p} \Rightarrow \text{if } \epsilon_{\gamma} \geq 100 \ \text{TeV} \Rightarrow E_{P} \gtrsim 10^{15} \text{ eV} = 1 \ \text{PeV}$ [neglecting boosting]

Context (III)

Gamma-ray production mechanisms in MQ jets (modulo activity states, radio/X-ray outbursts):

• Leptonic: IC - SSC or EC (e.g., with companion or interstellar radiation fields) (e.g., Atoyan & Aharonian 1999; Paredes+ 2000; Georganopoulos+ 2002; Bordas+2009...)

• $h\nu \sim \gamma_e m_e c^2$ (KN) \Rightarrow if $\epsilon_{\gamma} := h\nu \gtrsim 100 \text{ TeV} \Rightarrow \gamma_e \gtrsim 10^8$ [neglecting boosting]

- Hadronic: pp-interactions (e.g., with companion stellar wind or ISM/clouds) (e.g., Romero+ 2003; Dermer & Böttcher 2006; Bosch-Ramon+ 2006; ...)
 - ► mean energy $\varepsilon_{\gamma} \sim 0.1 \ E_{p} \Rightarrow \text{if } \epsilon_{\gamma} \geq 100 \ \text{TeV} \Rightarrow E_{p} \gtrsim 10^{15} \text{ eV} = 1 \ \text{PeV}$ [neglecting boosting]
 - MQs contribution to Galactic CR (knee)?

$$E_{\text{Hillas}} \simeq quBR \simeq 8 Z \left(\frac{B}{20 \ \mu\text{G}}\right) \left(\frac{u_s}{0.26c}\right) \left(\frac{R}{1.6 \text{ pc}}\right) \text{PeV} \text{ [SS 433]}$$

(compatible with $B_{\rm H} \sim 10^9 \dot{m}^{1/2} M_1^{-1/2} \,\mathrm{G}$) $\Rightarrow L_B = 2\pi R^2 u_B u_j \Rightarrow L_B \sim 10^{37} \left(\frac{0.2}{\beta_s}\right) \left(\frac{E/Z}{5 \,\mathrm{PeV}}\right)^2 \,\mathrm{erg/s}$

Context (III)

Gamma-ray production mechanisms in MQ jets (modulo activity states, radio/X-ray outbursts):

• Leptonic: IC - SSC or EC (e.g., with companion or interstellar radiation fields) (e.g., Atoyan & Aharonian 1999; Paredes+ 2000; Georganopoulos+ 2002; Bordas+2009...)

• $h\nu \sim \gamma_e m_e c^2$ (KN) \Rightarrow if $\epsilon_{\gamma} := h\nu \gtrsim 100 \text{ TeV} \Rightarrow \gamma_e \gtrsim 10^8$ [neglecting boosting]

PLASMA ASTRO

Fermi-type Particle Acceleration

Kinematic effect resulting from scattering off magnetic inhomogeneities ('clouds') E. Fermi, Phys. Rev. 75, 578 [1949]

- energy gain as results of <u>multiple scatterings</u> (stochastic process)
 - **_Ingredients:** in frame of scattering centre
 - momentum magnitude conserved
 - particle direction randomised

Fermi-type Particle Acceleration

Kinematic effect resulting from scattering off magnetic inhomogeneities ('clouds') E. Fermi, Phys. Rev. 75, 578 [1949]

- energy gain as results of <u>multiple scatterings</u> (stochastic process)
 - **_Ingredients:** in frame of scattering centre
 - momentum magnitude conserved
 - particle direction randomised

_Characteristic energy change per scattering (for non-relativistic V_c):

$$\Delta E = E_f - E_i = 2\left(E_i V_c^2 / c^2 - \overrightarrow{p_i} \cdot \overrightarrow{V_c}\right) \quad p_1 \simeq \frac{E_1}{c}$$

➡ energy gain for head-on ($\vec{p}_i \cdot \vec{V}_c < 0$), loss for following collision ($\vec{p}_i \cdot \vec{V}_c > 0$)

Fermi-type Particle Acceleration

Kinematic effect resulting from scattering off magnetic inhomogeneities ('clouds') E. Fermi, Phys. Rev. 75, 578 [1949]

- energy gain as results of <u>multiple scatterings</u> (stochastic process)
 - **_Ingredients:** in frame of scattering centre
 - momentum magnitude conserved
 - particle direction randomised

_Characteristic energy change per scattering (for non-relativistic V_c):

$$\Delta E = E_f - E_i = 2\left(E_i V_c^2 / c^2 - \overrightarrow{p_i} \cdot \overrightarrow{V_c}\right) \quad p_1 \simeq \frac{E_1}{c}$$

➡ energy gain for head-on ($\vec{p}_i \cdot \vec{V}_c < 0$), loss for following collision ($\vec{p}_i \cdot \vec{V}_c > 0$)

I. stochastic: average gain 2nd order: $\langle \Delta E \rangle \propto (v_A/c)^2 E$ II. shock: spatial diffusion, head-on, 1st order: $\langle \Delta E \rangle \propto (v_s/c) E$ III. stochastic-shear: drawing on 'systematic' velocity: $\langle \Delta E \rangle \propto (\Delta u_{sh}/c)^2 E$ with $\Delta u_{sh} \sim (\partial u/\partial x) \lambda$

Relativistic jets Compact object of center Accretion disk

For favourable conditions, Fermi-type particle acceleration known to produce power-laws: $n(p) \propto p^{-\alpha}$

For favourable conditions, Fermi-type particle acceleration known to produce power-laws: $n(p) \propto p^{-\alpha}$

- shock power-law index: $\alpha\simeq 2$
- "shear" power-law index depends on flow speeds
 - $\blacksquare \alpha \to 1$ for highly relativistic flows
 - → $\alpha \gg 1$ for sub-relativistic flows (FR & Duffy 2019, 2022)
- "classical Fermi-2" can be as hard as $n(p) \sim p^{-1}$
- \blacksquare energy content $\epsilon_p \propto p^2 n(p)$ growing
- ⇒ expect non-linear feedback to set-in: $\alpha \rightarrow 2$

(Lemoine, Murase & FR 2024)

For favourable conditions, Fermi-type particle acceleration known to produce power-laws: $n(p) \propto p^{-\alpha}$

- shock power-law index: $\alpha \simeq 2$
- "shear" power-law index depends on flow speeds
 - $\Rightarrow \alpha \rightarrow 1$ for highly relativistic flows
 - → $\alpha \gg 1$ for sub-relativistic flows (FR & Duffy 2019, 2022)
- "classical Fermi-2" can be as hard as $n(p) \sim p^{-1}$
- \Rightarrow energy content $\epsilon_p \propto p^2 n(p)$ growing
- $\Rightarrow expect non-linear feedback to set-in: \\ \alpha \to 2$

(Lemoine, Murase & FR 2024)

Example: 1st order Fermi (DSA) shock acceleration in SS 433

Re-brightening @ Standing Shock in pc-scale Outflow

- VHE emission up to $\sim 30 \text{ TeV}$
- leptonic EC modelling with $B = 20\mu$ G, v_s = 0.26c, injection power L_e~10³⁸ erg/s
- electron PL spectral index = 2 as expected for strong shocks
- energy-dependent morphology compatible with advection speed v_s/4 (= downstream of shock)
- max. electron energy (iff Bohm) $t_{\rm acc} \simeq 8\kappa/v_{\rm s}^2 = t_{\rm syn,e} \Rightarrow \gamma_{\rm e,max} \sim 4 \times 10^9$ (2 PeV)

Possible Acceleration Processes (characteristics)

Cartoon	TYPE	Applicability constraint	Power-Law expectation $n(p) \propto p^{-\alpha}$	Others
diffusion region	Reconnection	highly magnetised $\sigma \gg 1$	function of σ may reach $\alpha \sim 1$	<i>Guide field?</i> <i>max. Lorentz factor and</i> <i>particle slope are</i> <i>connected</i>
	Shock	weakly magnetised $\sigma \ll 1$	quasi-universal $lpha\simeq 2$	localized; e- injection problem? Maxwellian contribution?
	Shear	intermediately magnetised $\sigma \lesssim 0.3$	function of flow speed	extended emission; energetic seed injection needed
	Stochastic (2nd order)	sufficiently magnetised $\sigma \gtrsim 10^{-2}$	dependent on escape, may be as hard as $\alpha \simeq 1$	extended emission; turbulence characteristics? feedback

$$\sigma := B^2/(4\pi\rho c^2)$$

Illustration: SS 433-type, pc-scale parameters

(i.e., $B = 20\mu$ G; R = 1 pc; $v_s = 0.2$ c; but allowing for higher jet speeds $\Gamma_i \leq 2$)

- ⇒ electrons/protons: Hillas-constrained ⇒ may reach PeV energies (shock, shear)
- ⇒ 2nd Fermi providing seed injection into shear...

protons

14

Illustration: SS 433-type, pc-scale parameters

(i.e., $B = 20\mu$ G; R = 1 pc; $v_s = 0.2$ c; but allowing for higher jet speeds $\Gamma_i \le 2$)

- \Rightarrow electrons/protons: Hillas-constrained \Rightarrow may reach PeV energies (shock, shear)
- ⇒ 2nd Fermi providing seed injection into shear...

in non-relativistic jets, only shocks appear sufficiently effective (cf. diffusive escape)

Conclusion & Outlook

MQs are (potential) PeV particle accelerators

- \Rightarrow evidenced by gamma-ray emission beyond 100 TeV energies
- \Rightarrow MQs as possible contributors to CR flux around knee
- see (jet-related) gamma-ray emission originating far away from binary
 ⇒ need to 'fully' characterise emission (hadronic?!)
 ⇒ need to connect to jet physics (mildly relativistic; properties?)
- Fermi-type particle acceleration as promising conceptual framework ⇒ can reach Hillas-type maximum energies via shock or stochastic-shear
 - (for mildly relativistic jets)
 - ⇒ may in reality see combination of several processes (hybrid acceleration)
- need further "high-resolution" observations to progress...

Conclusion & Outlook

MQs are (potential) PeV particle accelerators

- \Rightarrow evidenced by gamma-ray emission beyond 100 TeV energies
- \Rightarrow MQs as possible contributors to CR flux around knee
- see (jet-related) gamma-ray emission originating far away from binary
 ⇒ need to 'fully' characterise emission (hadronic?!)
 ⇒ need to connect to jet physics (mildly relativistic; properties?)
- Fermi-type particle acceleration as promising conceptual framework
 - ⇒ can reach Hillas-type maximum energies via shock or stochastic-shear (for mildly relativistic jets)
 - \Rightarrow may in reality see combination of several processes (hybrid acceleration)
- need further "high-resolution" observations to progress...
